

Named Citation Report

Four articles naming Jain in technical discussion of methods, designs and research contributions.

4

selected articles

12

marked discussion pages

30

countries / territories in
the wider survey

Selection and source documentation

This report includes articles that name Jain in substantive body discussion, with the corresponding coauthored work identified through the bibliography. Entries describe the specific adaptation, implementation, comparison or technical explanation supported by the source, retaining joint attribution where several methods are credited.

Authorship links and documented scholarly use

Each article identifies the cited work and authors, the specific research connection and the original discussion pages. The bibliography link establishes authorship of the corresponding work by Sambhav R. Jain and coauthors.

Orange rectangles mark selected discussion, citations and TQT results; blue rectangles identify the corresponding bibliography entries. The marked packet follows the article order in this report and retains original page numbers. Article numbers identify the corresponding marked files.

International citation survey. The wider survey maps 210 citing works to 228 institution/location entries across 30 countries/territories. These totals describe the broader citation network, separately from this report's selection.

4 named citing articles

No.	Article / venue	PDF discussion pages	Scholar
11	Differentiable Model Compression via Pseudo Quantization Noise TMLR (September 2022)	3	79
13	AnalogNets: ML-HW Co-Design of Noise-robust TinyML Models and Always-On Analog Compute-in-Memory Accelerator arXiv:2111.06503 (2021)	6	32
09	Towards Machine Learning for Placement and Routing in Chip Design: a Methodological Overview arXiv preprint, 2022	5	27
10	Grid Synchronization Phase-Locked Loop Strategy for Unbalance and Harmonic Distortion Conditions Journal of Control, Automation and Electrical Systems 27 (2016), 463–471	2	15

Differentiable Model Compression via Pseudo Quantization Noise

Alexandre Défossez; Yossi Adi; Gabriel Synnaeve

TMLR (September 2022) · 79 Google Scholar citations

Named technical discussion

Documented contribution. Meta AI researchers name Jain et al., together with Esser et al. and Bhalgat et al., when comparing learned step size or dynamic range at fixed bitwidth with methods that also select bitwidth.

Named methodological comparison. Discusses learning step size or dynamic range at fixed bitwidth alongside Esser et al. and Bhalgat et al., in a comparison of quantization approaches.

Authorship link: Jain, Gural, Wu and Dick (2019), Trained quantization thresholds for accurate and efficient fixed-point inference of deep neural networks. [Bibliography p. 13](#).

Reviewed version: arXiv copy bearing Published in TMLR (09/2022) header. **Pinpoint:** PDF/printed p. 3, related work; bibliography p. 13; Paris and Tel-Aviv affiliations p. 1. Source E-0064; marked copy E-1147.

Count: E-0458, `data.organic_results[0].inline_links.cited_by.total`.

AnalogNets: ML-HW Co-Design of Noise-robust TinyML Models and Always-On Analog Compute-in-Memory Accelerator

Chuteng Zhou; Fernando Garcia Redondo; Julian Büchel; Irem Boybat; Xavier Timoneda Comas; S. R. Nandakumar; Shidhartha Das; Abu Sebastian; Manuel Le Gallo; Paul N. Whatmough

arXiv:2111.06503 (2021) · 32 Google Scholar citations

Named technical discussion

Documented contribution. Arm, IBM Research and ETH Zürich researchers describe a differentiable learned-range quantizer using a similar approach to Jain et al., followed by its mathematical definition.

Learned-range quantizer design. Connects the differentiable range-learning approach to Jain et al. in section 4.2 and equation 4 of the reviewed arXiv:2111.06503v1 preprint.

Authorship link: Jain, Gural, Wu and Dick (2019), Trained quantization thresholds for accurate and efficient fixed-point inference of deep neural networks. [Bibliography p. 12](#).

Reviewed version: Reviewed arXiv:2111.06503v1 preprint. **Pinpoint:** PDF/printed p. 6, section 4.2 and equation 4; bibliography p. 12; affiliations p. 1. Source E-0065; marked copy E-1149.

Count: E-0394, `data.organic_results[3].inline_links.cited_by.total`.

NAMED CITATIONS

ARTICLE 09 · NAMED CITATION REPORT

Towards Machine Learning for Placement and Routing in Chip Design: a Methodological Overview

Junchi Yan; Xianglong Lyu; Ruoyu Cheng; Yibo Lin
arXiv preprint, 2022 · 27 Google Scholar citations

Named technical discussion

Documented contribution. The routing overview explains Jain and Okabe's fully convolutional router in detail: encoded input layouts, 15 convolutional layers, eight output layout layers, and routing formulated as per-pixel, per-layer binary segmentation.

Named technical exposition. Describes the router's input representation, network architecture and per-pixel routing formulation in the survey's section on deep neural networks for routing.

Authorship link: Jain and Okabe (2017), Training a fully convolutional neural network to route integrated circuits. [Bibliography p. 7.](#)

Reviewed version: arXiv:2202.13564v1. **Pinpoint:** Physical PDF p. 5; bibliography p. 7. Source E-0646; marked copy E-0893.

Count: E-0444, data.organic_results[1].inline_links.cited_by.total.

ARTICLE 10 · NAMED CITATION REPORT

Grid Synchronization Phase-Locked Loop Strategy for Unbalance and Harmonic Distortion Conditions

Hicham Chaoui; Okezie Okoye; Mehdy Khayamy
Journal of Control, Automation and Electrical Systems 27 (2016), 463–471 · 15 Google Scholar citations

Named technical discussion

Documented contribution. The grid-synchronization article credits Jain et al. (2014) with optimizing phase-locked-loop dynamic response for fast tracking under disturbance.

Named related-work recognition. Identifies optimization of PLL dynamic response for fast tracking under disturbance as the contribution of Jain et al. (2014).

Authorship link: Jain, Ravikirithi and Chilakapati (2014), A novel self-consistent model based optimal filter design for the improved dynamic performance of 3-phase PLLs for phase tracking under grid imperfections. [Bibliography p. 9.](#)

Reviewed version: Published journal PDF. **Pinpoint:** Physical PDF p. 2; bibliography p. 9. Source E-0624; marked copy E-0894.

Count: E-0446, data.organic_results[1].inline_links.cited_by.total.

A citing work can appear in several publication rows. Unique survey totals group overlapping records and publication versions.

The saved Scholar profile records 354 citations. The inventory retains 323 works from 337 archived Scholar records. Publication affiliations establish locations for 210 works; the remaining 113 have their review status recorded in the inventory.

Dated Scholar responses document discovery and article-level counts. Source PDFs establish the selected discussions and affiliation evidence. The coverage table and inventory provide the denominators for each measure.

Publication-sourced affiliations and research connections

The map presents 228 institution/location entries from 210 grouped citing works in 30 countries/territories. Each pin opens the institutions, citing papers and affiliation-page evidence. Several institutions in one city share a display pin; multi-institution papers contribute several locations.

Affiliations come from the reviewed publication. Explicit campus and city details determine placement; ROR supplies institution-city geography when the publication lists an institution without a city. Hollow markers show country-level affiliations. Coordinates are geographic display anchors.

The map documents the geographic reach of citing authors' publication affiliations, including coauthor- and employer-linked works. Article passages establish methodological adaptation, implementation, comparison, design connections or technical exposition. Joint attribution is retained where several methods are credited.
